

Rocky Reach Fish Presence and Habitat Use Survey Summary

(Note: append to RL&L and Chris Fairbanks' stuff)

Depth, velocity, substrate and cover measurements were taken at all sampling sites where fish were captured in the late summer/fall sampling period. Measurements of habitat variables will continue to be taken during the spring and summer 2000 sampling periods.

Habitat information gathered at sites where fish were found will be analyzed and turned over the Aquatic Habitat Mapping group. This information will be used to show not only where fish have been found during surveys, but also to indicate other areas which have similar habitat characteristics.
