Hello Rocky Reach Wildlife Forum Members,

Attached is the 2018 annual mid-winter bald eagle monitoring report as required under the Rocky Reach Wildlife Habitat Plan (2015-2020). The survey was conducted on January 12, 2018, during the target dates for the mid-winter bald eagle counts conducted statewide.

Please contact me if you have any questions.

Also, we are updating our Rocky Reach Wildlife Forum (RRWF) contact list. Please let me know if you are no longer a representative of the RRWF and provide an alternate representative.

Sincerely,

Von

Winter Eagle Monitoring on Rocky Reach Reservoir

2018

Kelly A. Cordell and Von R. Pope
Public Utility District No. 1 of Chelan County
Fish & Wildlife Department
Wenatchee, WA 98807-1231
INTRODUCTION
The Public Utility District No. 1 of Chelan County (Chelan PUD) owns and operates the Rocky Reach Hydroelectric Project along the Columbia River in central Washington. This project operates under Federal Energy Regulatory Commission (FERC) license #2145-060. Rocky Reach Dam was licensed in 1957 and began generating electricity in 1961. The operating license was renewed in 2009. As prescribed in the Rocky Reach Wildlife Habitat Management Plan required by Article 403 of the Rocky Reach license and coordination with the Rocky Reach Wildlife Forum (RRWF), Chelan PUD continues to monitor numbers of wintering eagles along Rocky Reach Reservoir (Chelan PUD 2010). This annual report summarizes data collected on wintering bald eagles during January 2018.

HISTORY
From 1975 – 1984, the United States Fish and Wildlife Service (USFWS) conducted monthly aerial surveys for wintering bald eagles along the mid-Columbia River, including Rocky Reach Reservoir (Fielder and Starkey 1980). In 1988, Chelan PUD began regularly monitoring eagles during the winter months along Rocky Reach Reservoir.

The bald eagle was delisted from the Endangered Species Act (ESA) on 9 August 2007. As a result, Chelan PUD reduced the monitoring effort from bi-weekly to monthly during the winter months (November – March) beginning in the winter of 2007-08. The frequency of monitoring exceeded the level suggested in the bald eagle post-delisting monitoring plan (USFWS 2009) and provided sufficient trend information. Winter surveys allow Chelan PUD to determine distribution of wintering eagles along the Reservoir and to determine the age ratio of sub-adults: adults. In 2010, the first Rocky Reach Wildlife Habitat Management Plan was approved and directed Chelan PUD to continue winter bald eagle monitoring as conducted during the first license term. For the 2010 – 2015 Rocky Reach Wildlife Habitat Management Plan (RRWHMP), surveys were conducted monthly. With the approval of the 2016 – 2020 RRWHMP, surveys were to be conducted once per winter during January to coincide with the National Mid-winter Bald Eagle Survey (Chelan PUD 2015a).

This report summarizes the monitoring effort conducted under the Rocky Reach Wildlife Habitat Management Plan for January 2018.

STUDY AREA
Rocky Reach Dam is located approximately 7 miles north of the city of Wenatchee, Washington along the Columbia River at river mile 473.5. The pool behind the dam (Reservoir) extends 42 river miles north to Wells Dam (operated by Douglas County PUD) at river mile 515.5. Chelan and Douglas counties border the west and east shores of the reservoir, respectively.

The Reservoir is considered run-of-river with relatively limited water storage capability and active river currents, particularly in the deep main channel of the Columbia River. The Reservoir also has a combination of shallow bays, islands and island complexes, parks, residential, agricultural and natural habitats. Where natural habitat exists, steep cobble or dirt banks comprise much of the reservoir shoreline. Shrub steppe vegetation, fruit orchards, and residential or industrial areas occupy areas up-slope from the riparian edge of the river. Shrub steppe habitat of central Washington is dominated by big sagebrush (Artemisia tridentata), rabbitbrush (Chrysothamnus spp.), and bluebunch wheatgrass (Pseudoroegneria spicata) and is interspersed with pines such as ponderosa pines (Pinus
Ponderosa) and Douglas-fir (Pseudotsuga menziesii), especially along the hills to the west that comprise the Eastern Cascades Physiographic province (Franklin and Dyrness 1973). Cottonwoods (Populus balsamifera ssp. trichocarpa) of differing age groups can also be found along the shores of the river.

**SURVEY METHODS**

Since golden eagles are a sensitive species in Washington State, both bald and golden eagles are documented during the winter survey. Eagle surveys were conducted once during January 2018 to coincide within the date ranges (3 January – 17 January) for the national Mid Winter Bald Eagle Survey. A minimum of 2 observers were used on each survey. Surveyors on each side (port and starboard) of the boat monitored the respective shoreline (i.e., Chelan or Douglas) and both shorelines were surveyed concurrently while traveling upriver along Rocky Reach Reservoir.

Eagles were identified to species (bald or golden) and age class (adult or sub-adult) whenever possible. Bald eagles were classified as an adult if they exhibited an all-white head or as a sub-adult in any other color phase. Golden eagles were also aged based on plumage characteristics as described in Wheeler & Clark (1995). If age or species of eagles could not be identified, they were recorded as unknown species and/or unclassified age. The location of eagles observed was recorded to the 1/10th river mile as well as bank (Chelan or Douglas) and the perch substrate.

The eagle survey began at the Lincoln Rock State Park boat launch and proceeded along the Douglas County shoreline downriver to Rocky Reach Dam, then across the Reservoir to the Chelan County side and upriver along the Chelan County Shore to the upriver end of Turtle Rock Island (river mile 476). At this point the route crosses back over the main channel and downriver along the west side of Turtle Rock Island. At the downriver end of Turtle Rock Island the boat traveled back upriver, along the east shoreline of Turtle Rock Island and the Douglas County shoreline. From the upriver end of Turtle Rock Island, the survey route then continued upriver to the tailrace at Wells Dam. The river just below Wells Dam is quite wide, making it difficult for surveyors to see adequately from the middle of the river. Therefore, the boat cruised near the Douglas County shore beginning at river mile 515.0. Surveyors focused solely on the Douglas County shoreline at this point, continuing upriver to a safe distance below Wells Dam. After the tailrace area was thoroughly surveyed, the Chelan County shoreline was surveyed downriver to river mile 514.9 where the survey then terminated.

**RESULTS**

One survey was completed on 12 January 2018. A total of 46 eagles were observed along Rocky Reach Reservoir. Of these, 38 were bald eagles and 8 were golden eagles (Table 1).

**Age Ratios**

Knowing age ratios of wintering bald eagle populations is important because wintering areas with high proportions of sub-adult bald eagles often indicate an easily available food source which improves the survival chances of younger eagles (Stalmaster 1980, Fitzner et al. 1980, Fielder 1982, Bennetts and McClelland 1991). The number of sub-adult bald eagles observed during the January survey was 19. The age ratio of bald eagles wintering along the Reservoir for the survey was 1.0 sub-adults per adult (Table 1). Eagle observations by species and age class are represented in Figure 1.
**Perch Sites and Distribution**
Perch substrate was recorded for all eagles observed. Eagles were most commonly observed perched in cottonwoods, rocks or cliffs, and ponderosa pines during surveys (Table 2). Eagles were distributed fairly evenly along much of the Reservoir. Eagles were more frequently observed in the area between Turtle Rock and Stayman Flats, and also in the Howard Flats vicinity (Corral Creek to Wells Dam) (Figure 2).

**National Mid-Winter Bald Eagle Surveys**
The 12 January 2018 survey was conducted during the National Mid-Winter Bald Eagle Survey timeframe (3 – 17 January 2018). The National Mid-Winter Bald Eagle survey is overseen by the United States Geological Survey (USGS) and in coordination with the United States Army Corps of Engineers (ACOE). Data for the survey was submitted via email on 16 January 2018 to Stephen Lesky, ACOE, the Washington State coordinator for the national counts. Chelan PUD has participated in the National Mid-Winter Bald Eagle Survey effort since 2008.

**Long-term Summary**
The maximum number of bald eagles observed during the January 2018 survey was 38. During all January efforts 1989—2017 the average number of bald eagles observed was 33. The maximum number of eagles observed during January efforts 1989—2017 (n = 62) occurred twice, both during the 2013 and 2017 efforts.

**DISCUSSION**
The combined number of bald and golden eagles observed during the January 2018 survey was 46. Overall, wintering eagle numbers during the month of January are trending higher along Rocky Reach Reservoir in recent years (Figure 3). Recent winters have not been extraordinarily severe, and the winter of 2017—2018 thus far has seen less snow accumulation in the lower elevations along the Reservoir than usual. Additionally, Chelan PUD has seen an increase of bald eagles staying to nest along Rocky Reach Reservoir during the last decade.

In consultation with the Rocky Reach Wildlife Forum, Chelan PUD reduced its wintering bald eagle effort in 2008 following the delisting of the bald eagle from the ESA in 2007. This change was to continue winter monitoring with reduced effort during the 5-year period following delisting of the bald eagle. Survey effort during the winter months (November – March) was reduced from bi-weekly to monthly during the 2010 – 2015 RRWHMP (Chelan PUD 2010). As the 5-year period following delisting passed and wintering bald eagle numbers continued to increase, along with increasing numbers of nesting bald eagles along Rocky Reach Reservoir (Chelan PUD 2015b), the RRWF reduced the number of wintering surveys from once monthly to once per winter for the 2016 – 2020 RRWHMP. One survey was conducted during the 2018 effort because of this reduction in survey effort under the 2016 – 2020 RRWHMP.

RRWF determined that the annual single winter count shall coincide with the National Mid-Winter Bald Eagle survey. Chelan PUD has submitted January survey data annually since 2008 for Rocky Reach Reservoir in conjunction with the National Mid-Winter survey effort. The January effort ensures the peak of the winter season is surveyed and the data set will continue to be shared with the National Mid-Winter Bald Eagle survey coordinators.
